# Einleitung, System und Nomenklatur.

## Einleitung.

Das der ersten Auflage dieses Werkes\* zugrunde gelegte System ist — mit einer unwesentlichen Änderung — auch für diese Auflage in Anwendung gekommen und möge noch einmal kurz erläutert werden.

Das Alphabet des Systems oder die Reihenfolge der mit dem Kohlenstoff verbundenen Elemente, geordnet nach ihrer Häufigkeit, ist folgende:

1. **H, O, N; Cl, Br, J, F; S, P**
2. Alle übrigen Elemente, alphabetisch geordnet **A—Z**.

Die Anordnung richtet sich

- a) in erster Linie nach der Zahl der Kohlenstoffatome;
- b) in zweiter Linie nach der Anzahl der neben C im Molekül vorkommenden anderen Elemente;
- c) in dritter Linie nach der Art der neben C im Molekül vorhandenen Elemente im Sinne des sub 1. gegebenen chemischen Alphabets;
- d) in vierter Linie nach der Anzahl von Atomen jedes einzelnen Elementes, das in der Verbindung außer C vorkommt.

## Bemerkungen.

1. Ableitung der Bruttoformel. Das den Tabellen sich anschließende Namenregister (mit Formelangabe) dient zur Ableitung der Formel in allen Fällen, wenn, in Ermangelung einer Strukturformel, die Bruttoformel der Stammsubstanz dem Gedächtnis nicht gegenwärtig ist.

\* Unter dem Titel: „Tabellen der Kohlenstoffverbindungen“ von M. M. Richter. — Berlin 1884. R. Oppenheim.

## Introduction.

The system which was used in the first edition of this work\* has also been adopted in this edition, with the exception of quite an unessential alteration which scarcely touches its practical application. I will give again a brief exposition of this system.

The alphabet of the system or the succession of the elements combined with carbon, as determined by the frequency of their occurrence, is as follows:

1. **H, O, N; Cl, Br, J, F; S, P**
2. All the other elements are placed in alphabetical order: **A—Z**.

The arrangement depends:

- a) on the number of carbon atoms;
- b) on the number of the other elements which, in addition to C, are contained in the compounds;
- c) on the kind of elements (which in addition to C are contained in the molecule) in accordance with the chemical alphabet given under (1.);
- d) on the number of atoms of each element which, in addition to C, is contained in the compound.

## Remarks.

1. Deduction of the empirical formula. The index of names (with their formulae) which accompanies the tables, will enable the reader to deduce the formula even if he is at a loss to record the empirical formula of the mother-substance.

\* Under the title: “Tabellen der Kohlenstoffverbindungen“ by M. M. Richter. — Berlin 1884. R. Oppenheim.

## Introduction.

Le système servant de base à la première édition de cet ouvrage\* a été aussi suivi, à part une légère modification, dans cette nouvelle édition, et je veux en faire cette fois-ci encore un court exposé.

L'alphabet du système ou, si l'on veut, l'ordre dans lequel se suivent les éléments combinés au carbone, est basé sur la fréquence relative de ces éléments:

1. **H, O, N; Cl, Br, J, F; S, P.**
2. Tous les autres éléments sont rangés dans l'ordre alphabétique de **A** à **Z**.

L'arrangement se base

- a) en première ligne sur le nombre d'atomes de carbone;
- b) en seconde ligne sur le nombre des autres éléments qui composent une molécule conjointement avec le carbone;
- c) en troisième ligne sur la manière dont les éléments constitutifs d'une molécule joints au carbone se trouvent rangés d'après l'alphabet chimique indiqué à 1.;
- d) en quatrième ligne enfin sur le nombre d'atomes, outre C, qui entrent dans une combinaison.

## Remarques.

1. *Déduction de la formule brute.*  
L'index des noms (avec leurs formules), qui se trouve à la fin des tables, facilite la recherche de la formule d'un corps dans tous les cas où la formule de structure étant inconnue, on n'a pas la formule brute de la substancemère présente à la mémoire.

\* Sous le titre: „Tabellen der Kohlenstoffverbindungen“ von M. M. Richter. — Berlin 1884. R. Oppenheim.

## Introduzione.

Il sistema che ha servito di base alla prima edizione di quest' opera\* sarà seguito anche in questa — con modificazioni affatto insignificanti che non riguardano quasi punto l'uso pratico — come verrò qui esponendo brevemente.

L'alfabeto del sistema, vale a dire l'ordine con cui si susseguono gli elementi uniti al carbonio, tenuto conto della loro relativa frequenza, è il seguente:

1. **H, O, N; Cl, Br, J, F; S, P.**
2. Tutti gli altri elementi in ordine alfabetico dall' **A** alla **Z**.

L'ordinamento dipende:

- a) in primo luogo dal numero degli atomi di carbonio;
- b) in secondo luogo dal numero degli altri elementi, che, oltre al carbonio, sono contenuti nella molecola;
- c) in terzo luogo dalla specie degli elementi presenti col carbonio nella molecola, e ciò, secondo l'ordine precedentemente indicato al capo verso 1.;
- d) in quarto luogo dal numero degli atomi di ciascun elemento, che oltre al carbonio, entra nella combinazione.

## Avvertenze.

1. *Deduzione della formola bruta.*  
L'indice dei nomi annesso alle tabelle (coll' indicazione delle formole) serve per quei casi nei quali, mancando una formola di struttura, non si abbia presente alla memoria la formola bruta della sostanza madre.

\* Sotto il titolo „Tabelle dei composti del carbonio“ di M. M. Richter. — Berlin 1884. R. Oppenheim.

Um beispielsweise zu den Bruttoformeln der Tarkoninderivate zu gelangen, schlägt man zunächst im Namenregister Tarkonin =  $C_{11}H_9O_3N$  auf, und ist nun imstande, in den eigentlichen Tabellen sich über  $C_{11}H_8O_3NBr$  Bromtarkonin bzw. andere Tarkoninderivate zu orientieren.

2. Erklärung der Zentralblattnotiz. Seit dem Jahre 1902 haben neben den Zitaten der Originalliteratur auch die entsprechenden Zitate der Zentralblatt-Referate Aufnahme gefunden, so daß das Lexikon vom Beginn des Jahres 1902 ab auch ein Formelregister für das von der Deutschen Chemischen Gesellschaft herausgegebene Chemische Zentralblatt bildet.

Diese kombinierten Zitate sind gekennzeichnet durch das Fehlen des trennenden und sonst gebrauchten Semikolon, z. B. (*C. r.* 133, 938 *C.* 1902 [1] 207). Die Zitate *C. r.* 133, 938 und *C.* 1902 [1] 207 beziehen sich also auf eine und dieselbe Arbeit, auf die französische Originalarbeit und das entsprechende deutsche Referat im Chem. Zentralblatt.

3. Erklärung und Bedeutung der Beilsteinnotiz. Bei jeder Verbindung findet sich am Schluß, außerhalb der Literaturklammer, eine aus römischen und arabischen Ziffern kombinierte Zahlennotiz, vom Verfasser „Beilsteinnotiz“ genannt, z. B. bei:

$C_9H_{10}O_3$  Melilotsäure die Notiz II, 1562.

Dieselbe bezieht sich stets auf die dritte Auflage des Handbuches der organischen Chemie von BEILSTEIN und soll anzeigen, daß die Melilotsäure im Band II, Seite 1562 dieses Handbuches zu finden ist. Eine mit einem Stern versehene Beilsteinnotiz, z. B. \*II, 462 bezieht sich auf die Beilsteinsupplemente.

Das Lexikon bildet gleichzeitig somit für das Handbuch von Beilstein ein Generalregister par excellence, denn sämtliche im „Beilstein“ aufge-

To ascertain, for instance, the empirical formula of the derivatives of tarconine, one refers in the index of names to tarconine =  $C_{11}H_9O_3N$ , and thus one is able to obtain in the tables information about  $C_{11}H_8O_3NBr$ , bromtarconine or other derivatives of tarconine.

2. Explanation of the reference to the "Zentralblatt". From the year 1902 in addition to the references to the original literature, the corresponding references to the "Zentralblatt" have been given; the lexicon, therefore, is at the same time, from the beginning of that year, an index of formulae for the "Zentralblatt" published by the German Chemical Society.

These combined references are indicated by the omission of the semicolon after the reference to the original paper; e. g. (*C. r.* 133, 938 *C.* 1902 [1] 207). The references *C. r.* 133, 938 and *C.* 1902 [1] 207, therefore, refer to one and the same publication, namely to the original paper in the French Journal and to the corresponding abstract in the "Chem. Zentralblatt".

3. Explanation and importance of the reference to "Beilstein". To every compound are affixed two figures, one in roman, the other in arabic numerals, called by the author "Beilsteinnotiz"; e. g.:

$C_9H_{10}O_3$ , Melilotic acid  
carries the figures II, 1562.

These refer always to the third edition of BEILSTEIN's handbook of organic chemistry, and are meant to indicate that melilotic acid is described there in Vol. II, p. 1562. A reference to "Beilstein" to which an asterisk is affixed, e. g. \*II, 462, refers to the supplements of "Beilstein".

The lexicon is, therefore, at the same time a collective index par excellence to "Beilstein", for all the compounds which are regi-

Pour établir, par exemple, la formule brute des dérivés de la tarconine, on cherche d'abord à l'index des noms le mot tarconine =  $C_{11}H_9O_3N$  et l'on se trouve alors en état de s'orienter facilement, à l'aide de tables spéciales, sur le bromure de tarconine =  $C_{11}H_8O_3NBr$  et autres dérivés de la tarconine.

2. Explication de la notice du «Zentralblatt». A partir de l'année 1902 les citations des résumés du «Zentralblatt» ont été enregistrées à côté de celles des articles originaux, de sorte que depuis cette époque ce dictionnaire est devenu aussi un registre des formules du «Zentralblatt» rédigé par la société de chimie en Allemagne. (Deutsche Chemische Gesellschaft.)

Ces citations combinées se caractérisent par leur manque de point et virgule, v. gr. (C. r. 133, 938 C. 1902 [1] 207). Les citations C. r. 133, 938 et C. 1902 [1] 207 se rapportent au seul et même travail, à l'original français et à son résumé dans le «Chemische Zentralblatt».

3. Explication et importance de la notice de Beilstein. Après la bibliographie mise entre parenthèses concernant chaque combinaison, on trouve une citation combinée en chiffres romains et en chiffres arabes que l'auteur appelle «Beilsteinnotiz», v. gr.:

$C_9H_{10}O_3$  = acide mélilotique  
est accompagné de la notice II, 1562, qui se rapporte toujours à la troisième édition du manuel de chimie organique de BEILSTEIN et indique que l'acide mélilotique se trouve dans ce traité à la page 1562 du second volume. Une notice de «Beilstein» marquée d'un astérisque, v. gr. \*II, 462 indique en renvoi au supplément de «Beilstein».

Ainsi ce dictionnaire constitue en même temps un index collectif par excellence pour le manuel de Beilstein, car il tient compte de toutes les com-

Per avere, ad esempio, la formula bruta di derivati della tarconina si trova prima nell' indice dei nomi: tarconina =  $C_{11}H_9O_3N$ , e si può allora dirigersi nella relativa tabella alla ricerca del corpo  $C_{11}H_8O_3NBr$ , o bromotarconina, e così di seguito per gli altri derivati.

2. Spiegazioni intorno al „richiamo al Zentralblatt“. Dall' anno 1902 viene dato oltre che la citazione della letteratura originale, anche il corrispondente richiamo al sunto del Zentralblatt: così che il Dizionario dal principio del 1902 costituisce anche un Formulario del *Chemisches Zentralblatt pubblicato dalla Deutsche Chemische Gesellschaft*.

Questo richiamo combinato è contrassegnato dalla mancanza di interpunzione, che è sempre altrimenti impiegata, p. es. (C. r. 133, 938 C. 1902 [1] 207). La citazione C. r. 133, 938 e C. 1902 [1] 207 si riferisce a uno stesso lavoro, cioè alla sua originale redazione francese, e al corrispondente sunto nel Chem. Zentralblatt.

3. Spiegazioni intorno al „richiamo al Beilstein“ e sua importanza. Per ogni composto dopo la bibliografia che lo concerne, la quale è posta fra parentesi, vi è una citazione espressa in numeri arabi e romani che l'autore chiama „richiamo al Beilstein“; così ad es. per:

$C_9H_{10}O_3$  Acido melilotico  
la citazione II, 1562.

Questa si riferisce sempre alla terza edizione del manuale di chimica organica del BEILSTEIN, e sta ad indicare che l'acido melilotico si trova in questo manuale a pagina 1562 del secondo volume. Un richiamo al Beilstein contrassegnato da un asterisco p. es. \*II, 462 si riferisce al supplemento del Beilstein.

È così che il Dizionario costituisce nello stesso tempo l'indice generale per eccellenza del manuale del Beilstein, perchè contiene

führten Verbindungen, etwa 96 000 Stück, sind berücksichtigt worden.

Das Fehlen dieser Beilstein- notiz bei etwa 54 000 Verbindungen weist stets darauf hin, daß diese außer- gewöhnlichen Literaturquellen entnom- men sind oder der neueren Literatur angehören.

4. Jede Verbindung nimmt in den Tabellen nur einen, und zwar ihren systemgemäß feststehenden Platz ein, mit Ausnahme der Salze, welche bei den be- treffenden Stammverbindungen aufgeführt sind. Die Chloride, Bromide, Jodide und Cyanide der Diazonium- und qua- ternären Ammoniumbasen dagegen sind als selbständige Verbindungen registriert.

5. Polymere Verbindungen, deren Molekulargewichte sicher festgestellt sind, sind unter der Gesamtformel zu suchen, z. B.:

$(\text{CHON})_3$  Cyanursäure unter  $\text{C}_3\text{H}_3\text{O}_3\text{N}_3$ .

6. Von den Literaturquellen sind so- wohl diejenigen angegeben, welche auf Darstellung und Eigenschaften der be- treffenden Verbindung Bezug haben, wie auch solche, welche näherliegende Zer- setzungen und Umsetzungen behandeln. Abhandlungen rein theoretischen, analy- tischen, physikalischen, mathematischen, kristallographischen und medizinisch- physiologischen Inhalts sind nicht immer berücksichtigt worden.

7. Die Namen der Autoren sind fort- gelassen, um die notwendige Kürze zu erzielen.

8. Die Literatur ist in Übereinstim- mung mit dem Chemischen Zentralblatt etwa bis Mitte November 1909 referiert.

9. Als eine unliebsame Arbeits- erschwerung habe ich bei zahlreichen Abhandlungen das Fehlen der Brutto- formeln empfunden, und ich bitte daher die Fachgenossen, den Analysenzahlen in Zukunft stets die Bruttoformel beizu- fügen und diese beim Niederschreiben wie auch beim Korrekturlesen auf ihre Richtigkeit zu prüfen.

stered there; about 96 000 have been dealt with.

The references to "Beilstein" are not to be found after about 54 000 com- pounds, and this fact indicates that they either have been described in ob- scure papers or that they occur in the recent literature.

4. Every compound has in the table only one place which is fixed by the system, with the exception of the salts which are placed with the compounds they are derived from. The chlorides, bromides, iodides and cyanides of quater- nary ammonium bases, however, are re- gistered as group-substances.

5. Polymeric compounds with fixed molecular weights are registered under their own formulae; e. g.

$(\text{CHON})_3$ , cyanuric acid is found under  $\text{C}_3\text{H}_3\text{O}_3\text{N}_3$ .

6. The work contains the references to the papers which describe the methods of preparation of the compounds and their properties, as well as those which deal with the immediate changes they undergo. No reference is made to purely theoretical papers, nor to those with ana- lytical, physical, mathematical, crystallo- graphic and medico-physiological contents.

7. Authors' names I have omitted for the sake of brevity.

8. In accordance with the "Chem. Zentralblatt", the literature is treated up to the middle of november 1909.

9. My work has been made rather heavy on account of the circumstance that empirical formulae had been omitted in numerous papers; I, therefore, beg fellow-workers in future to add the em- pirical formulae to the analytical data and to check them in writing the manu- script as well as in reading the proof.

binaisons qui se trouvent dans « Beilstein » et qui sont au nombre d'environ 96 000.

Il y a à peu près 54 000 combinaisons qui ne se rencontrent pas dans « Beilstein », ce qui indique toujours que ces combinaisons sont décrites dans des revues peu connues ou sont de publication récente.

4. Chaque combinaison occupe dans les tables une seule place, qui lui est fixée d'après le système établi, à l'exception toutefois des sels, qui sont placés près des combinaisons dont ils dérivent. Par contre les chlorures, les bromures, les iodures, les cyanures des bases quaternaires d'ammonium sont regardés comme des types propres et enregistrés comme tels.

5. Les composés polymères, dont les poids moléculaires sont bien déterminés, doivent être cherchés d'après leur formule propre, v. gr:

l'acide cyanurique  $(\text{CHON})_3$  d'après la formule  $\text{C}_3\text{H}_3\text{O}_3\text{N}_3$ .

6. Les publications ayant rapport à la préparation et aux propriétés de ces combinaisons, ainsi que celles qui traitent de leurs plus importantes décompositions et transformations, seront citées. Celles au contraire concernant des questions purement théoriques ou analytiques, physiques ou mathématiques, cristallographiques ou médico-physiologiques, ne le seront pas toujours.

7. Pour arriver à une brièveté indispensable les noms des auteurs ont dû être omis.

8. La bibliographie a été traitée en conformité de vues avec le « Chemischen Zentralblatt » jusqu'à la mi-novembre 1909.

9. Les formules brutes qui faisaient défaut dans nombre de publications ont souvent rendu ma tâche plus ardue encore et je prie mes collègues de bien vouloir à l'avenir ajouter toujours la formule brute aux chiffres fournis par l'analyse et d'en contrôler l'exactitude aussi bien avant que pendant la correction des épreuves.

tutte le 96 000 sostanze in quello descritte.

La mancanza del richiamo al Beilstein per circa 54 000 composti proviene da ciò, che essi sono tolti da fonti bibliografiche non comuni, o appartengono a pubblicazioni recenti.

4. Ogni composto ha nelle tabelle un solo posto e cioè quello che gli compete in ragione del sistema, fatta eccezione pei sali, che sono messi presso la loro sostanza madre. I cloruri, bromuri, ioduri e cianuri delle basi quaternarie ammoniche, vengono al contrario registrati come corpi a se.

5. I polimeri, la formola dei quali è ben accertata, vanno ricercati sotto la loro formola complessiva; così ad es:

$(\text{CHON})_3$  acido cianurico sotto  $\text{C}_3\text{H}_3\text{O}_3\text{N}_3$ .

6. Delle citazioni bibliografiche si danno sia quelle che concernono la preparazione e le proprietà dei singoli corpi, come anche quelle che trattano delle più importanti loro decomposizioni e trasformazioni. I lavori di argomento puramente teorico, o analitico; oppure che trattano questioni fisico-matematiche, cristallografiche, o che interessano la medicina e la fisiologia, non vengono presi in considerazione.

7. I nomi degli autori sono ommessi per la necessaria brevità.

8. La letteratura è in concordanza col Chem. Zentralblatt fino circa alla metà del Novembre 1909.

9. Uno spiacevole ostacolo fu da me incontrato in questa compilazione per la mancanza delle formole brute in molti lavori; io prego quindi i cultori della chimica di volere in avvenire aggiungere sempre ai dati analitici la formola bruta, e di controllarne l'esattezza sia nell'estensione della memoria, sia ancora nella correzione delle bozze di stampa.

Die Fachgenossen würden sodann auch im Interesse der Einheitlichkeit handeln, wenn sie die in diesem Lexikon angewandte Anordnung der empirischen Formeln akzeptieren wollten, wie dies seitens des Vorstandes der Deutschen Chemischen Gesellschaft bekanntlich schon für den Jahrgang 1898 der „*Berichte*“ beschlossen worden ist, so z. B.:

### Nomenklatur.

Von den mannigfachen Schwierigkeiten, welche sich im Laufe der Bearbeitung dieses Werkes einstellten, war die Frage:

„welche Nomenklatur im Interesse der Einheitlichkeit und Übersichtlichkeit dem Werke zugrunde zu legen sei,“

zweifelloß die schwerwiegendste. Wie heute in weitaus verstärktem Maße, so lagen auch damals, also vor zwanzig Jahren, als diese Frage zur endgültigen Entscheidung gebracht werden mußte, die bekannten Mißstände auf diesem Gebiete schon klar zutage. Es ist und bleibt bedauerlich, daß auch die in Genf gefaßten Beschlüsse keine Aussicht haben, sich allgemeiner Anwendung zu erfreuen.\*

Die zahlreichen Regeln, welche das Gebiet der aliphatischen Verbindungen, und zwar unvollständig umfassen, der geringe Fortschritt auf den übrigen Gebieten der organischen Chemie, wie vor allem die den Fachgenossen aufgedrängten Gedankenoperationen bei dieser Nomenklatur lassen keinen Zweifel an der Richtigkeit oben geäußelter Ansicht übrig.

Die Frage nach einer befriedigenden Nomenklatur für dieses Lexikon führte, namentlich in Anbetracht des Fehlens jeglicher Strukturformel, welche der Raum-

For the sake of uniformity it would recommend itself, if workers would adopt the arrangement of the empirical formulae as used in this lexicon, which has been resolved upon by the Council of the German Chemical Society to come into practice in the year 1898 of the „*Berichte*“. Thus one should write:

### Nomenclature.

Of the many difficulties which in writing this work presented themselves, the greatest was undoubtedly the question:

“Which nomenclature is to be adopted for the sake of uniformity and clearness.”

The unfortunate state of things in this respect had already shown itself nine years ago, when this question had to be dealt with, and it is now aggravated. It is and remains deplorable that the resolutions arrived at Geneva have no prospect of being generally adopted.\*

The numerous rules which embrace, though incompletely, the group of aliphatic compounds, again the small progress concerning the other parts of organic chemistry, and above all the mental operations which this nomenclature necessitates, do not leave any doubt that the view expressed above is correct.

Taking into consideration that structural formulae had to be omitted in order to save space, the question as to a satisfactory nomenclature for this lexicon,

\* Mit Ausnahme der durchaus zweckentsprechenden Nomenklatur der aliphatischen Kohlenwasserstoffe.

\* With the exception of the specially appropriate nomenclature of the aliphatic hydrocarbons.

Dans l'intérêt de l'uniformité il serait bon aussi de voir tous les chimistes accepter l'ordre des formules empiriques, tel qu'il a été suivi dans ce dictionnaire, comme cela a déjà été fait pour le « Berichte » de l'année 1898 sur le conseil du comité de la société de chimie en Allemagne, v. gr:

### Nomenclature.

Parmi les multiples difficultés, qui surgirent dans le cours de la rédaction de ce travail, une des moins aisées à résoudre était sans doute celle de savoir

« quelle est la nomenclature qu'il faut adopter dans l'intérêt de l'unité et de la clarté ».

Ce misérable état de choses, qui se faisait déjà clairement sentir il y a vingt ans, alors qu'on se proposait de résoudre définitivement cette question, a encore beaucoup empiré de nos jours. Il est malheureusement peu probable que les résolutions prises par le congrès de Genève soient partout adoptées, ce qui est vivement à déplorer.\*

Les nombreuses règles qui embrassent le groupe des combinaisons aliphatiques, et encore d'une manière bien imparfaite, le peu de progrès réalisé dans les autres parties de la chimie organique et, avant tout, les efforts de mémoire auxquels doivent s'astreindre les chimistes pour s'appropriier les termes de cette nomenclature ne laissent aucun doute sur ce qui vient d'être avancé plus haut.

Vu que les formules de structure devaient être évitées faute de place, restait alors à savoir quel serait le système de nomenclature qui conviendrait le mieux

\* A l'exception de la nomenclature très rationnelle des hydrocarbures aliphatiques.

Sarebbe poi desiderabile, che gli autori per uniformità accettassero per le formole empiriche l'ordine adottato in questo dizionario come è stato già fatto, notoriamente, dalla Società chimica di Berlino per l'annata 1898 dei suoi „Berichte“, e così ad esempio:

### Nomenclatura.

Tra le molteplici difficoltà che si incontrarono nel corso della compilazione di questo lavoro la più difficile a risolversi consisteva indubbiamente

nella scelta e nell'adozione di una nomenclatura che rispondesse per unità e chiarezza allo scopo dell'opera.

Le sfavorevoli circostanze in questo argomento, le quali sono oggi grandemente cresciute, si presentavano però in modo assai chiaro già nove anni fa, allorchè tale questione doveva ricevere una definitiva risoluzione. Resta poi a deplorarsi che anche le conclusioni del Congresso di Ginevra non abbiano alcuna probabilità di essere generalmente adottate.\*

Le numerose regole che riguardano esclusivamente la nomenclatura dei composti alifatici — ed anche questi in modo incompleto —; la piccolissima estensione data finora alla parte riguardante gli altri campi della chimica organica; soprattutto poi il fatto che questa nomenclatura non è di immediata comprensione, stanno a provare la giustezza dell'asserto suesposto.

La questione della scelta di un sistema di nomenclatura soddisfacente pel presente dizionario fu risolta coll'adozione esclusiva del „*principio della sostituzione*“,

\* Fatta eccezione della nomenclatura degli idrocarburi grassi, che realmente risponde allo scopo.

ersparnis wegen nicht gegeben werden konnten, schließlich immer wieder auf das „Prinzip der Substitution“, welches in folgenden Sätzen kurz zusammengefaßt werden soll.

1. Jede Verbindung, deren Konstitution sicher festgestellt ist, wird auf die ihr zugrunde liegende Stammsubstanz, nämlich den Kohlenwasserstoff oder das betreffende wasserstoffärmste Ringsystem wie Benzol, Naphtalin, Pyrrol, Furan, Chinolin usf. zurückgeführt.

2. Diese Stammsubstanz wird bei der Namenbildung der Derivate intakt erhalten und muß stets als solche in den Namen der Derivate figurieren, darf also in keinem Falle eine Umbildung erfahren, wie z. B. Pyrazol in Pyrazolin, Inden in Indanon usw.

3. Hydrierte Stammsubstanzen werden als Di-, Tetra-, Hexa-, Okto-, Dekahydroderivate bezeichnet: also Dihydropyrazol für Pyrazolin, oder Tetrahydropyrazol für Pyrazolidin.

4. Als Namen für die Stammsubstanzen werden benutzt:

- a) für die Kohlenwasserstoffe der aliphatischen Reihe die Namen, wie solche sich aus den Beschlüssen der Genfer Nomenklaturkommission ergeben;
- b) für die aromatischen Kohlenwasserstoffe die bisher gebräuchlichen Namen, wie Benzol, Inden, Naphtalin, Anthracen;
- c) für die **O, S, Se, N, P** enthaltenden Ringsysteme, die sich diesem Text anschließenden Formen S. 14, wie solche sich sinngemäß aus der Erweiterung der WIDMANNschen Vorschläge ergeben.

5. Wie die Bildung der Derivate obiger Stammsubstanzen durch Ersetzung von Wasserstoff durch andere Atome oder Atomgruppen gedacht werden kann, so erfolgt auch die Namenbildung dieser Derivate:

compelled me to adopt the "*principle of substitution*". This may be summarised as follows.

1. Every compound with fixed constitution is referred to the group-substance from which it is derived, namely to the hydrocarbon or to the corresponding cyclic system which contains the smallest number of hydrogen atoms, as benzene, naphthalene, pyrrol, furan, quinoline etc.

2. This group-substance remains intact in naming the derivatives and must always figure as such in the names of the derivatives, an alteration may never take place, as for instance that of pyrazole into pyrazoline or indene into indanone etc.

3. Hydrogenised group-substances are named di-, tetra-, hexa-, octo-, decahydroderivatives. Thus dihydropyrazole for pyrazolidine.

4. The following names are used for the group-substances:

- a) for the hydrocarbons of the aliphatic series, those which are in concordance with the resolutions of the Geneva nomenclature commission;
- b) for the aromatic hydrocarbons the terms used up to the present, such as benzene, indene, naphthalene, anthracene;
- c) for the ring-systems containing **O, S, Se, N, P** the forms which are affixed to this text (page 14) and which naturally follow from the expansion of WIDMANN's proposals.

5. As the formation of the derivatives of group-substances may be regarded as taking place by the substitution of hydrogen by other atoms or groups, so are the names derived from those of the group-substances.

au présent dictionnaire, et finalement il a toujours fallu en revenir au «*principe de substitution*» qui va être brièvement résumé dans les lignes qui suivent.

1. Toute combinaison, dont la constitution est sûrement établie, est ramenée au groupe de la substance fondamentale d'où elle dérive, savoir: à l'hydrocarbure ou au système cyclique le moins riche en hydrogène, tel que le benzène, la naphthaline, le pyrrol, le furane, la chinoline etc.

2. Le nom de cette substance fondamentale reste intact dans l'appellation des dérivés et doit toujours figurer sans altération dans les noms de ces dérivés. Ainsi il ne sera pas permis de transformer la dénomination de pyrazol en celle de pyrazoline, d'indène en celle d'indanone etc.

3. Les substances fondamentales hydrogénées sont précédées des préfixes di, tétra, hexa, okto, déca; on dira par exemple dihydropyrazol au lieu de pyrazoline, ou bien, tétrahydropyrazol au lieu de pyrazolidine.

4. Au sujet des dénominations des substances fondamentales on adoptera:

a) pour les hydrocarbures aliphatiques, celles qui ont été arrêtées par la commission du congrès de Genève;

b) pour les hydrocarbures aromatiques, celles qui ont eu cours jusqu'ici, v. gr: benzène, indène, naphthaline, anthracène;

c) pour les systèmes cycliques, contenant **O, S, Se, N, P**, les formes qui se trouvent à la page 14 de ce livre, telles qu'elles résultent de l'extension des propositions de WIDMANN.

5. Si la formation des dérivés des substances fondamentales susdites peut être considérée comme se faisant par la substitution d'autres atomes ou de groupes d'atomes à l'hydrogène, on pourra alors très bien concevoir la formation des noms de ces dérivés:

tanto più che si dovettero escludere interamente le formole di costituzione per economia di spazio. Diamo qui riassunte in breve le regole derivanti da questo principio:

1. Ogni composto di costituzione sicuramente stabilita viene riferito alla sostanza fondamentale da cui deriva, idrocarburo o sistema ciclico meno ricco in idrogeno, come benzolo, naftalina, pirrolo, furano, chinolina etc.

2. Il nome di queste sostanze fondamentali viene mantenuto intatto nella formazione dei nomi dei derivati, e deve figurare come tale in essi; non può quindi subire giammai modificazioni del genere p. es. di quella di pirazolo in pirazoline, di indene in indanone etc.

3. Le sostanze fondamentali idrogenate si indicano cogli epiteti: Di-, Tetra-, Esa-, Octo-, Deca-idroderivati; si dirà così diidropirazolo invece di pirazolina, e tetraidropirazolo invece di pirazolidina.

4. Come nomi delle sostanze fondamentali si adoperano:

a) per gli idrocarburi della serie alifatica i nomi che si derivano dalle conclusioni del congresso di Ginevra;

b) per gli idrocarburi aromatici, i termini finora in uso, come: benzolo, indene, naftalina, antracene;

c) per sistemi ciclici contenenti **O, S, Se, N, P**, le forme che si trovano raccolte a pag. 14, come esse risultano in modo naturale dall'estensione delle proposte di WIDMANN.

5. La formazione dei nomi dei derivati si fa nello stesso modo con cui può ritenersi che avvenga la sostituzione dell'idrogeno del corpo fondamentale con altri atomi o gruppi di atomi; p. esempio:

	<i>Common name</i>	<i>Names to be substituted</i>
	Trivialname	Substitutionsname

$C_6H_4.OH.COOH$	Salicylsäure	2-Oxybenzol-1-Carbonsäure.

Der chemische Ort ist bei offenen Ketten durch griechische Buchstaben und bei Ringsystemen stets durch Ziffern gekennzeichnet.\*

Die hierbei innegehaltene Reihenfolge ist aus den auf den folgenden Seiten gegebenen Beispielen zu ersehen.

Zum Aufsuchen der betreffenden Stammsubstanz dient ein den Beispielen direkt sich anschließendes kleines Register.

With open-chain compounds the position of the substituent is indicated by the Greek alphabet, and with ring-compounds by numbers.\*

The way they succeed each other can be seen from the examples which are given on the following pages.

A small index follows the examples and enables one to look for the group-substance.

\* Den Beschluß der Genfer Nomenklaturkommission, in jedem Falle Zahlen anzuwenden, halte ich für einen Fehler.

\* I regard it as a great mistake to follow the resolution of the Geneva nomenclature commission in using numbers in every case.

La position occupée par les substituants est désignée par des lettres grecques dans les chaînes ouvertes et toujours par des chiffres dans les systèmes cycliques.\*

Les exemples, qui figurent dans les pages qui suivent, montreront l'ordre qui a été suivi.

Si l'on veut chercher une substance fondamentale on aura recours à un petit index qui vient après les exemples.

Il luogo chimico dei sostituenti è sempre indicato nelle catene aperte con lettere greche, e nei sistemi ciclici con cifre.\*

L'ordine da seguirsi in questa indicazione risulta dagli esempi contenuti nelle pagine seguenti.

Per la ricerca delle sostanze fondamentali serve un piccolo registro contenente le forme semplici, che segue immediatamente gli esempi.

\* Je considère comme une faute la décision prise par la commission de nomenclature du congrès de Genève de recommander d'employer des chiffres dans tous les cas.

\* Io giudico come un grande errore la decisione del Congresso di Ginevra di adoperare numeri in tutti i casi.

- $C_4H_{13}O_9N_2$  1) Verbindung (aus Hydrazin u. Dioxymalonsäureester). Zers. bei 125 bis 130° (C. 1909 [1] 1469).
- $C_4H_{13}N_2Cl$  1) Chloräthylat d. uns-Dimethylhydrazin (Dimethyläthylazoniumchlorid). 2 +  $PtCl_4$  (B. 13, 2172). — I, 1148.
- $C_4H_{14}O_{12}S_9$  1) Säure (aus Äthylenrhodanid).  $Na_4$  (A. 153, 325). — I, 1280.
- $C_4H_{15}O_8J$  1) Verbindung (aus Methylalkohol u. Jodmethyl). Sd. 37,9°<sub>760</sub> (Bl. [3] 25, 572).
- $C_4H_{15}N_4S$  1) uns-Dimethylhydrazoniumsulfid (B. 40, 1481 C. 1907 [1] 1314).
- $C_4OCl_3Br$  1) Trichlorbromfuran. Sm. 75—76°. — III, 691.
- $C_4OCl_5Br_4$  1) Hexachlortetrabromdiäthyläther? Sm. 96° (A. ch. [3] 16, 25). — I, 301.
- $C_4O_2Cl_3J_2$  1) Chlorid d. Dijodfumarsäure. Sm. 49° (B. 26, 847). — \*I, 324.
- $C_4O_3ClBr$  1) Anhydrid d. Chlorbrommaleinsäure. Sm. 113°; Sd. 203° (B. 29 [2] 186). — \*I, 324.
- $C_4O_5N_2Br_2$  1) 3,4-Dibrom-2,5-Dinitrofuran. Sm. 151—152°. +  $C_6H_6$  (Am. 10, 391). — III, 691.
- $C_4O_5Br_3S_8$  1) Anhydrid d. 2,5-Dibromthiophen-3,4-Disulfonsäure. Sm. oberhalb 200° (B. 17, 1569). — III, 743.
- $C_4N_2Cl_2J_2$  1) Dichlordijod-1,3-Diazin. Sm. 159° (B. 34, 4179 C. 1902 [1] 265). — \*IV, 550.
- $C_4N_2Cl_3J$  1) Trichlorjod-1,3-Diazin. Sm. 93—94° (B. 34, 4180 C. 1902 [1] 265). — \*IV, 550.
- $C_4N_4S_4Si$  1) Rhodansilicium. Sm. 142° (143,8°); Sd. 314,2° (A. ch. [5] 11, 343; Soc. 89, 397 C. 1906 [1] 1241, 1692). — I, 1521.

### $C_4$ -Gruppe mit vier Elementen.

- $C_4HONCl_4$  1) 3,4,5,5-Tetrachlor-2-Keto-2,5-Dihydropyrrol (Dichlormaleïnimidchlorid). Sm. 147—148° (A. 295, 79, 87). — \*I, 778.
- $C_4HONBr_2$  1) Mukobromsäureamidanhidrid. Sm. 153° (B. 34, 1020).
- $C_4HO_2NCl_2$  1) 4,5-Dichlor-6-Keto-1,2-Oxazin (Mucochloressäureoximanhydrid). Sm. 76 bis 77° (Am. 19, 657). — \*I, 192.  
2) Imid d. Dichlormaleinsäure. Sm. 179° (176° u. Zers.). (Ag,  $NH_3$ ) (B. 16, 2393; Am. 16, 304; 18, 334; G. 32 [2] 32 C. 1902 [2] 902). — I, 1390; \*I, 778.
- $C_4HO_2NCl_4$  1)  $\alpha\alpha\beta\beta$ -Tetrachlor- $\beta$ -Cyanpropionsäure? (Perchloreycanpropionsäure). Sm. 200°.  $NH_4$  (A. ch. [3] 16, 72). — I, 1219.
- $C_4HO_2NCl_6$  1) Imid d. Trichloressigsäure. Sm. 81° (J. pr. [2] 74, 153 C. 1906 [2] 1116).
- $C_4HO_2NBr_2$  1) 4,5-Dibrom-6-Keto-1,2-Oxazin. Sm. 117—118° (125°) (Am. 16, 299; B. 32, 536). — \*I, 193.  
2) Imid d. Dibrommaleinsäure. Sm. 225° (218°). Ag (J. 1877, 706; 1882, 368; B. 17, 556, 1745; 20, 2598; Am. 16, 301; 18, 335). — I, 1390; \*I, 778.
- $C_4HO_2N_2J_3$  1) Trijodnitrpyrrol. Zers. bei 185—187°.  $NH_4$ , Na, K (C. 1901 [1] 946). — \*IV, 67.
- $C_4HO_2N_3Cl_2$  1) 2,4-Dichlor-5-Nitro-1,3-Diazin. Sm. 29,3°; Sd. 153—155°<sub>58</sub> (B. 39, 252 C. 1906 [1] 659).
- $C_4HO_2Cl_2Br$  1) Monobromid d. Dichlormaleinsäure (Mucochloressäurebromid). Sm. 36° (Am. 16, 285). — \*I, 253.

- $C_4H_3O_3Br_3S_2$  1) 2,3,5-Tribromthiophen-4-Sulfonsäure. Ba +  $H_2O$  (B. 18, 1775). — III, 745.
- $C_4HO_4N_3Br_2$  1) 3,4-Dibrom-2,5-Dinitropyrrol +  $H_2O$ . Sm. 169° u. Zers. (B. 20, 2597, 2600). — IV, 65.
- $C_4HO_4N_3J_2$  1) Dijoddinitropyrrol. Sm. 190—192° u. Zers. K (C. 1901 [1] 946). — \*IV, 67.
- $C_4HO_4ClJ_2$  1) Jodfumarsäurejodosochlorid (A. 369, 129 C. 1909 [2] 2070).
- $C_4HO_4Cl_2J$  1) Chlorfumarsäurejodosochlorid. Sm. 119—120° u. Zers. (B. 38, 2843 C. 1905 [2] 1230; A. 369, 125 C. 1909 [2] 2070).
